

Yocto session 19-recipe development (dependencies) part 8

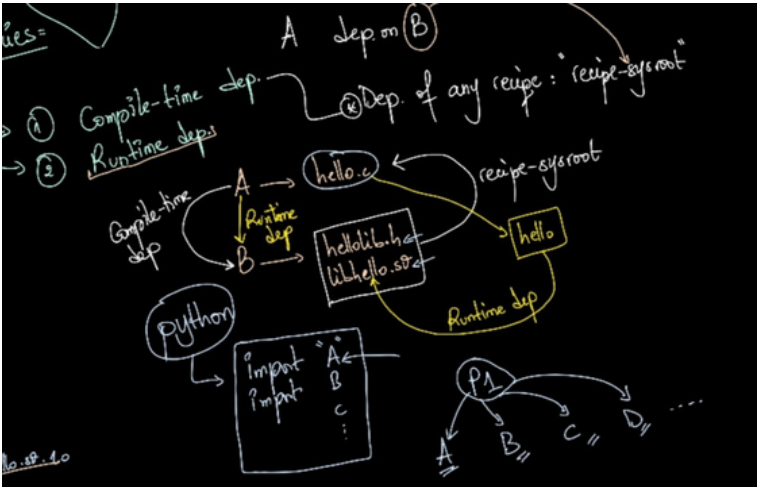

If we have makefile in our project we don't need do_compile

Geeneraly any headerfiles must be in /usr/include/stdio.h.....

With yocto we must use another rootfs for here directory (/usr/include/)

Yocto build rootfs "d" _recipe -sysroot_ This in workdir

Dependencies :
* compile time depen
* Runtime depn

The project that need runtime dependencies are python recipe (python interprété)

DEPEND += hellolib

The liker don't found Hellolib.so because we have hellolib.so.1.0 so we use symbolique link (ln)

We create symbolic link by absolute path

With Install in recipe we can manipulate the permission without it we must use chmod
