

SO2 session 15 -ELF
format

* Compressed image : bzipimage
* Uncompressed image : VmLinux (for
debugging)

System.map gives list of all symbols in
kernel ~ nm (shell)

GDB : gnu project debugger (example
of coredump)

It can support the remote features
that's mean gdb can debugging on the
current machine and can debugging
remotely by executing gdb server and
gdb clien to take gdb session
