

Yocto Session 17 - Recipe Development (Variable Expansion) Part 6

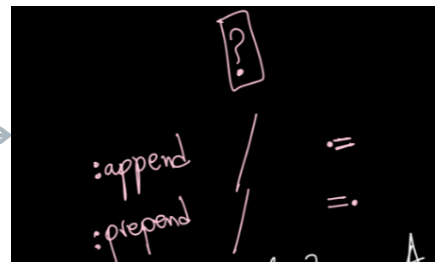

steps in yocto

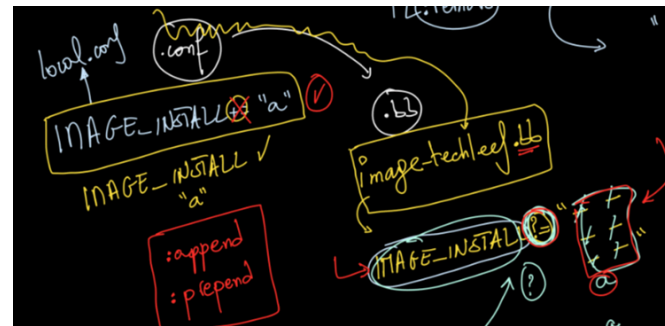

variable expansion

- prepend and append
- take on hold to the final of code the prepend
- add value in the left and append add value in the right

example of append and
prepend

we add variable "TL" in local.conf : how to display here value => run command `$ bitbake-getvar --value TL`

TL2 = "\$ {TL}" : value of TL2 take the value before the execution of all the instruction (final value)

TL2 := “\${TL}” get the current value of TL

- remove example : rules only the final value

overrides
