Before we compile our kernel w need the .config file (do_configure)

Yocto native, nativesdk, cross, crosssdk, crosscanadian and BitBake Debugging

error => .config

Zoom in do_compile:

- Processor (.h not found)
- compiler (syntax error)
- assembler (verification)
- linker (library, .so not found)

Error from Git : we use do_patch

error from do_install :

just copy the folder image (generally we didn't face problem)

error do_package :

easy and can solved by the community support

Bitbake Linux: it must prepare all the environment (paresing, loade bblayers.conf, load machine.conf, local.conf, definition of all machine)

to hasten the compilation :
manually we can execute do_compile
without bitbake => go directly to the
workspace/script run do_compile

note : doesn't display warn, error : displayed

do_compile : if we run ls the ls of yocto is running
